

ABSTRACT

HANDWRITING TEXT INPUT SYSTEM

A data to input and display, character by character or (word pattern element) data by (word pattern element) data, is looked up in a dictionary to find a unique line of text or pattern element data to represent a unique word which could be the number of codes less than that in the dictionary and which includes data input (Fig. 2 and 3). If successful, the remainder of the data to input is automatically supplemented from the dictionary (Fig. 3). Relevant words for the unique word in the dictionary may be shown for the selection to replace on the display.
